

Diagnostics of students' degree of tolerance to migrants from different confessions and cultures

For common diagnostics of tolerance degree was used express questionnaire "Index of tolerance" developed by Soldatova G., Kravtsova O., Huhlaev O. and Shaigerova L., modified by Leontiev.

Stimulate material of questionnaire was made of statements which show both common relations to the surrounding world and other social groups and social settings in different spheres of interactions, where tolerance and intolerance are shown. Statements showing attitude to some social groups (for example, minorities, mentally ill people and poor people) are also included into methodic. Special attention is paid to ethnic tolerance-intolerance (attitude to people of other race and ethnic group, own ethnic group, cultural distance assessment). Two subscales of questionnaire are supposed to diagnose ethnical tolerance and social tolerance. Respondents filled in the answers sheet.

We got the average statistical indicator of common tolerance of respondents thanks to express questionnaire "Index of tolerance". Indicator is 58,2 points and it's average.

We saw gender differences but they are not really big. It's 60,0 points for girls and 57,2 points for boys. As expected, girls are more tolerant to other ethnic groups than boys.

Tolerant and intolerant manifestations to different social groups (minorities, criminals and mentally ill people) and personal settings to some social processes were studied on a "social tolerance" subscale.

Most respondents (93%) showed average level of social tolerance, also some of them showed high level (6%). We should pay attention to the fact that almost nobody showed low level, which tells of readiness to rational conflict resolutions with different social groups.

We got interesting results by "ethnic tolerance" subscale during the diagnostics. The highest results (high level of tolerance which is 28,2 points) were shown by respondents who live in Moscow since birth (46 people). After them, by a large margin, are the respondents who live in Moscow from 6 to 10 years (12 people). They got average level (29,0 points). On the last place are the respondents who live in Moscow more than 10 years (22 people). They got average level (28,5 points)
